# Human Development

- Human development – or the human development approach - is about expanding the richness of human life, rather than simply the richness of the economy in which human beings live. It is an approach that is focused on people and their opportunities and choices.

# Human Development Index and SGD

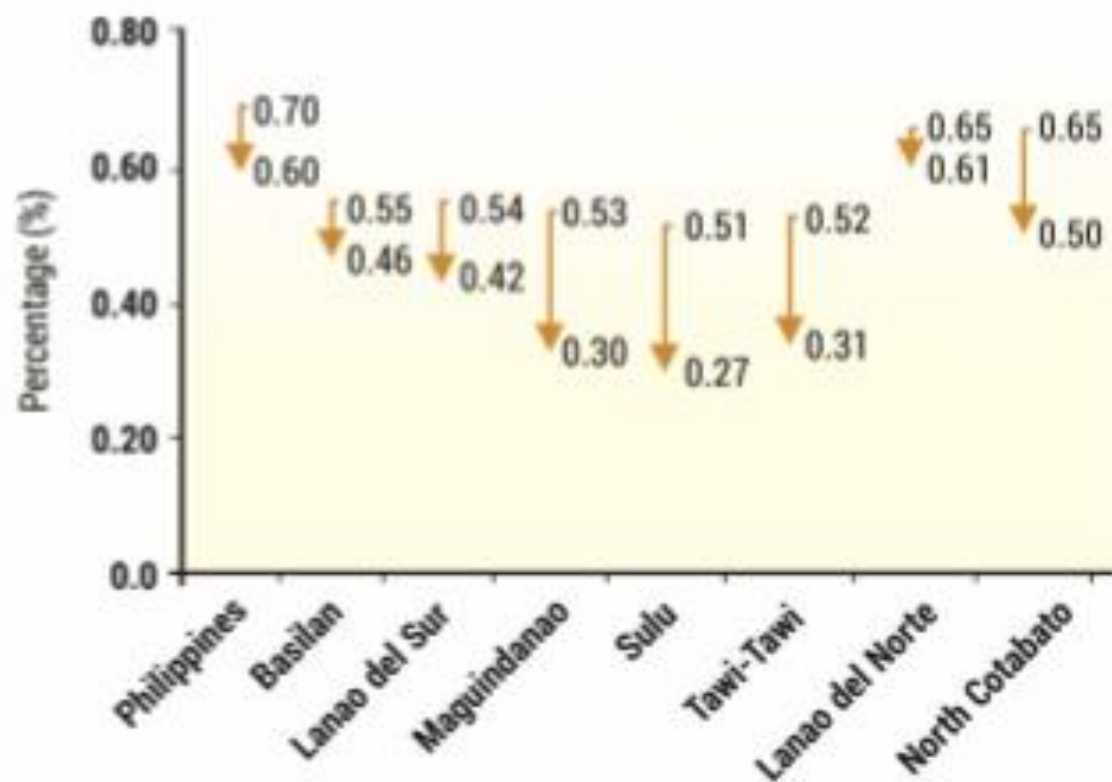

# Human Development Index

- The Human Development Index (HDI) is a tool to measure the overall achievements in three basic dimensions of human development, namely, longevity, knowledge, and a decent standard of living.
- It is premised on the principle that human development cannot be measured by the yardstick of income alone since income is a means, not an end, and there is no automatic link between income growth and human progress.
- Source: <http://www.hdn.org.ph/human-development-index-hdi/>

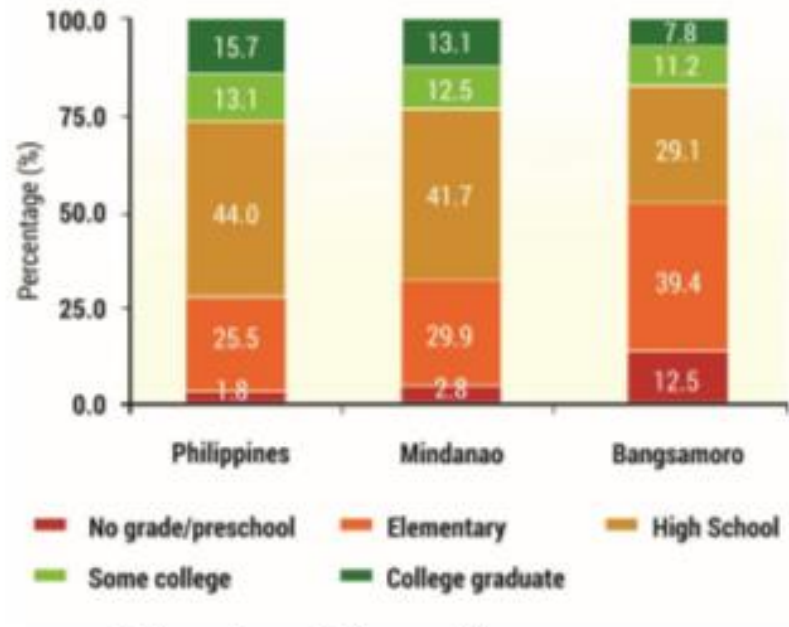

- The value of HDI ranges from 0 to 1.
- An HDI very close to 1 means that the **barangay** had very high values of each of three components above.
- Since these components are attempts to measure the development of the human being, a high HDI means that a high level of human development has been achieved.
- Internationally, a country with an HDI of .80 or higher is said to have a high level of human development. On the other end of the pole are countries with an HDI lower than .50.

# Benefits

- Much of the responsibility to help improve Filipinos' quality of life has to be monitored and implemented at the local unit, relevant information, particularly on issues affecting human development, will greatly help local leaders in planning and implementing effective programs or projects that will improve the lives of their constituencies.

# Recommendation

- Capacity building at the barangay level in data gathering, data cleansing, storage, and transmission to contribute accurate data at the national level.

THANK YOU!
